CALEDONIA GRANITE

Granite is a common and widely occurring type of igneous rock, and is formed by the slow cooling and crystallizing of molten stone under pressure. Granites usually have a medium to coarse grained texture and can be pink to dark gray or even black.

Granite is one of the three most popular architectural building stones in addition to limestone and sandstone.

Caledonia Granite is classed as a brown granite and is distinctive by way of its large dark crystals.

Caledonia Granite is often specified for its formal appearance complemented by its durability.

Caledonia Granite is available as flagging, treads, steps and slab material for custom fabrication.
